Section: W 5-7P, 89 Dwinelle

Description

This course is intended to be a seminar in which we discuss research designs which have succeeded. Few causal inferences in the social sciences are compelling. We carefully examine successful examples to see why they work. The seminar is also a form for students to discuss the research designs and methods needed in their own work. It should be particularly helpful for students writing their prospectus or designing a major research project. The seminar will be supplemented by lectures to cover the statistical and computational material needed to understand the readings such as matching methods, instrumental variables, regression discontinuity, and Bayesian, maximum likelihood and robust estimation. Applications are drawn from a variety of fields including political science, economics, sociology and public health.

Prerequisites

Prerequisites: One of Political Science 236 (The Statistics of Causal Inference in the Social Sciences), Statistics 215 (Statistical Models) or equivalent. PS236 is recommended, and experience with R is assumed.

Evaluation

The primary purpose of this class is to read and reflect on each set of readings and for students to write a term paper. We do not assign a lot of pages, but students are expected to read what is assigned very carefully. Class discussion is absolutely essential to the success of a seminar, and active participation is an important component of your overall evaluation. There will also be infrequent homework assignments. Students will be expected to briefly present their work in
progress at the end of the course. Final grades will be based on class participation and discussion (25%), infrequent homework assignments (25%) and the final paper (50%).

It is recommended that students write the term paper jointly with one or at most two other students. Experience has shown that this greatly facilitates learning as well as increases the likelihood that the paper will eventually become a published article. Students may hand in a more polished version of their ps236 papers or papers they are working on for other classes.

Homework assignments are infrequent (about three during the semester). Assignments will mainly consist of replicating and expanding upon the results of a paper or published article. Although it is recommended that people work together in order to complete the assignments, students must hand in their own individual answers. Photocopies and other reproductions of someone else’s answers are not acceptable. Students should hand in the answers to the problem sets, and all computer code written to find those answers.

Course Software and Books

The programming language for this course is the \texttt{R} variant of the \texttt{S} statistical programming language. It is available for download from: \url{http://www.r-project.org/} \texttt{R} is open source software (released under the GNU public license) and is available at no charge. We will also be making extensive use of an \texttt{R} package called “Matching” (Sekhon forthcoming).

The following books on \texttt{R} may be of interest:

Course outline

If you want some more indepth examples, see

4. Beginning the example of incumbency advantage.

• A new design: Lee (forthcoming): “Randomized Experiments from Non-random Selection in U.S. House Elections”

For background on Regression Discontinuity Design see:

• Thistlethwaite and Campbell (1960): “Regression-Discontinuity Analysis: An alternative to the ex post facto experiment”

• Hahn, Todd, and van der Klaauw (2001): “Identification and Estimation of Treatment Effects with a Regression-Discontinuity Design”

5. Another design for estimating incumbency advantage.

• Sekhon and Titiunik (2007): “Exploiting Tom DeLay: A New Method for Estimating Incumbency Advantage and the Effect of Candidate Ethnicity on Turnout”

6. Computers, Pencils and Controls as Opposed to Regression

7. Education as a treatment: returns to Education

8. Estimating media effects in the field

• Lenz and Ladd: “Exploiting a Rare Shift in Communication Flows: Media Effects in the 1997 British Election”

9. Fixing Experiments?

• Imai, Kosuke. ”Do Get-Out-The-Vote Calls Reduce Turnout? The Importance of Statistical Methods for Field Experiments.” American Political Science Review

• Green and Gerber Reply
• Bowers, Jake and Ben Hansen. 2005. “Attributing Effects to A Cluster Randomized
Get-Out-The-Vote Campaign.”

10. Synthetic Cohorts

• Abadie and Gardeazabal (2003): “The Economic Costs of Conflict: a Case-Control
Study for the Basque Country”

11. Voting Irregularities

• Wand, Shotts, Sekhon, Walter R. Mebane, Herron, and Brady (2001): The Butterfly
Did It: The Aberrant Vote for Buchanan in Palm Beach County, Florida

• Herron and Sekhon (2005): Black Candidates and Black Voters: Assessing the Impact
of Candidate Race on Uncounted Vote Rates

For additional examples see:

• Mebane and Sekhon (2004): Robust Estimation and Outlier Detection for Overdispersed
Multinomial Models of Count Data

• Herron and Wand (forthcoming): Assessing Partisan Bias in Voting Technology: The
Case of the 2004 New Hampshire Recount

• Sekhon (2004): The 2004 Florida Optical Voting Machine Controversy: A Causal Anal-
ysis Using Matching
